```
monoclonal antibody 13-1 heavy chain - mouse (fragment)
C; Species: Mus musculus (house mouse)
C; Saccession: PC4436
R; Akashi, S.; Kato, K.; Torizawa, T.; Dohmae, N.; Yamaguchi, H.; Kamachi, M.; Haradi, Biochem: Biophys. Res. Commun. 240, 566-572, 1997
A; Title: Structural characterization of mouse monoclonal antibody 13-1 against a porp A; Reference number: JC5810; MUID:98063277
A; Reference number: JC444
A&AA>
C; Comment: This catalytic antibody has peroxidase oxidase activity. It is directed against immunoglobulin homology
C; Comment: This catalytic antibody has peroxidase oxidase activity. It is directed against immunoglobulin homology
F; 251-320/Domain: immunoglobulin homology **Status predicted*
F; 29/Disulfide bonds: interchain (to 98) **status predicted*

SPECIES FOR IG GAMMA CHAINS. THE MAJOR SPECIES ENCODES SECRETED GAMMA CHAINS. A LESS ABUNDANT SPECIES APPEARS TO ENCODE MEMBRANE-BOUND CHAINS IN THAT IT CONTAINS AN ALTERNATIVE 3' END, ENCODED IN SEPARATE EXONS, THAT IS HOMOLOGOUS WITH THE MEMBRANE-BOUND SEGMENT OF MU CHAINS.

263pp; English. Claim 2 ; Page 174-176;

Interior describes a nover numerized anti-ras antibody like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas indead system, by bindibiting binding between fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunosuppressive, thyronimetic, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive (inhibition of ligand binding. (I) are used to treat and/or prevent clubes exphematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Slorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autohimune hemolytic anemia, sterility, mysathenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fase, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic murine disease models. (I) act on the active site of Fas, i.e. they minic murine disease models. (I) act on the active site of Fas, i.e. they minic murine a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu 2 which is described in the method of the invention. This invention describes a novel humanized anti-Fas antibody-like

treating or preventing e.g. apoptosis selectively in New humanized anti-Fas antibody, useful for inflammatory or autoimmune disease, induces cells with abnormal Fas-Fas ligand systems

Claim 2; Page 169-170; 263pp; English.

This invention describes a novel humanized anti-Fas antibody-like molecule (1) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents oppotosis in cells with a normal system, by inhibiting batween Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, anti-anemic, anti-allergic, anti-arthiritic, antivaral, anti-arthiritic, antivaral, cartiarthritic, antivaral, anti-arthiritic, antivaral, cartiarthritic, cardiant and hepatropic activity. (1) induce antiarterisoclerotic, cardiant and hepatropic activity. (1) induce antiarterisoclerotic, cardiant and hepatropic activity. (1) induce antiarterisoclerotic, cardiant and hepatropic activity. (1) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (1) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, soleroderma, Goodpature syndrome, Crohn's anemia, Addison's disease, scleroderma, Goodpature syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B. C or D) or alcoholic), and transplant rejection. (I) selectively

ô
inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu I which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                        240

The invention relates to compositions for the prevention or treatment containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA, via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS represent the heavy chains (or fragments thereof) of various humanised HFETA-derived anti-Fas antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fas; antibody; human; anti-inflammatory; anti-anemic; antidiabetic; anti-allergic; anti-artictic; antiviral; immunodulatory; cardiant; dermatological; immunosuppressive; thyrominetic; antirheumatic; anti-Fas; nephrotropic; antilnfertility; neuroprotective; antiarteriosclerotic; nephrotropic; humanized; apoptosis; systemic lupus erythematosus; Hashimoto disease; rheumatoid arthritis; graft versus host disease; Sjorgen's syndrome; anemia; Addison's disease; scleroderma; sterility;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180
